

Turn Recycled PET into what looks like Virgin PET

Join the Sustainability Movement without Sacrificing Product Appearance

Recycled PET often has a yellowish tint to it and hurts the appearance of the end product. If you think about the appeal of water bottles, food packaging, etc., they all draw consumers in because of how clear and clean they look.

Americhem's Renewal Additive allows PCR, which has a yellow tint, to be restored to PET PCR that looks very close to natural. This preserves the appearance of the water bottle or food packaging to continue being clear and appealing, but also recycled and much more sustainable.

Americhem's PET Renewal Additive Advantage:

- Overcomes the common yellowing of recycled PET
- Environmentally friendly- we do not use any heavy metals or metal oxides
- Increases the amount of recycled content in your product

Make the change and don't sacrifice the product; contact Americhem today for our PET Renewal Additive to clean up your recycled PET.
